MARKING

The thermistors have no marking and have electrode termination design without orientation.

MOUNTING

The thermistors are primarily intended for wire bonding or sintering. Contact specifications (thickness material) and bonding parameters are available on request. The parameters of the assembly process should be chosen in accordance with the lead-wire material.
The mounting process should be in compliance with the following guidelines and recommendations:

Die bonding: reflow soldering under vacuum or with formic acid / forming gases, with SAC or HMP / silver epoxy gluing / nano silver paste sintering.

Cleaning:

- Detergent spraying
- Ultrasonic cleaning is allowed if limited in time to 5 minutes

Wire bonding:

- The silver electrode has been tested for aluminum wire bonding with a wire diameter of max. 300 µm

Encapsulation:

- In order to preserve the characteristics of the bonded die at long term an encapsulation is mandatory
- The encapsulation is defined by the user. Silicon and epoxy encapsulations have been tested. For recommendations on compatible encapsulants contact Vishay
