

INA310x-Q1 AEC-Q100, -4 V to 110 V, 1.3 MHz, Ultra-Precise Current Sense Amplifier With Open-Drain Comparator and Reference

1 Features

- AEC-Q100 qualified for automotive applications:
 - Temperature grade 1: -40°C to $+125^{\circ}\text{C}$, T_A
 - Functional Safety-Capable
 - Documentation available to aid functional safety system design
- Wide common-mode voltage:
 - Operational voltage: -4 V to +110 V
 - Survival voltage: -20 V to +120 V
- High signal bandwidth: 1.3 MHz
- Slew rate: 2.5 V/ μs
- Excellent CMRR: 160 dB
- Accuracy
 - Gain error (maximum)
 - Version A: 0.15%, 10 ppm/ $^{\circ}\text{C}$ drift
 - Version B: 0.5%, 20 ppm/ $^{\circ}\text{C}$ drift
 - Offset voltage (maximum)
 - Version A: $\pm 20 \mu\text{V}$, $\pm 0.25 \mu\text{V}/^{\circ}\text{C}$ drift
 - Version B: $\pm 150 \mu\text{V}$, $\pm 1 \mu\text{V}/^{\circ}\text{C}$ drift
- Onboard open-drain comparator
- Internal comparator voltage reference: 0.6 V
- Propagation delay time: 1 μs
- Latching capability on comparator
- Available gains:
 - INA310A1-Q1, INA310B1-Q1 : 20 V/V
 - INA310A2-Q1, INA310B2-Q1 : 50 V/V
 - INA310A3-Q1, INA310B3-Q1 : 100 V/V
 - INA310A4-Q1, INA310B4-Q1 : 200 V/V
 - INA310A5-Q1, INA310B5-Q1 : 500 V/V
- Package options: VSSOP-8

2 Applications

- eTurbo/charger
- Electric power steering (EPS)
- Starter/generator
- Regenerative braking
- Brake system

3 Description

The INA310x-Q1 is an ultra-precise current sense amplifier that can measure voltage drops across shunt resistors over a wide common-mode range from -4 V to 110 V, independent of supply voltage with an integrated comparator. The high precision current measurement accuracy is achieved through a combination of low offset voltage (20 μV , maximum), small gain error (0.15%, maximum) and a high DC CMRR (160 dB, typical). The INA310x-Q1 has a high signal bandwidth of 1.3 MHz designed for high voltage DC current measurements and high-speed applications like fast overcurrent protection.

The INA310x-Q1 incorporates an open-drain comparator and internal reference that provides a 0.6 V threshold. An external resistive divider sets the current trip point. The comparator includes a latching capability that can be made transparent by grounding (or leaving open) the $\overline{\text{RESET}}$ pin.

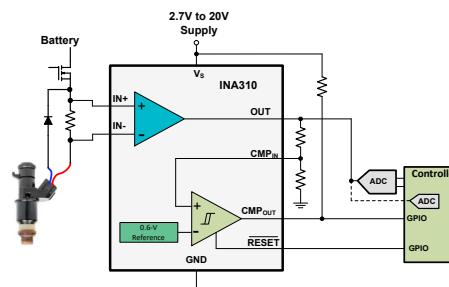

The INA310x-Q1 operates from a single 2.7 V to 20 V supply and draws 1.6 mA of supply current. The INA310x-Q1 is available in five gain options: 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V. These gain options address a wide dynamic range of current-sensing applications.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
INA310A-Q1		
INA310B-Q1	VSSOP (8)	3.00 mm × 4.90 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

Typical Application

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

5 Pin Configuration and Functions

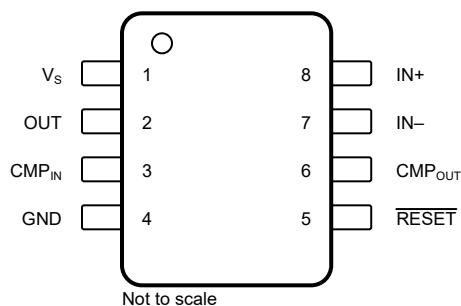

Figure 5-1. INA310x-Q1: DGK Package 8-Pin VSSOP Top View

Table 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO		
V _S	1	Power	Power supply, 2.7 V to 20 V
OUT	2	Output	Output voltage
CMP _{IN}	3	Input	Comparator input
GND	4	Ground	Ground
RESET	5	Input	Comparator reset pin, active low (Low: Transparent Mode, High: Latch Mode)
CMP _{OUT}	6	Output	Comparator output (latch high when RESET = High)
IN-	7	Input	Shunt resistor negative sense input. For high-side applications, connect to load side of sense resistor. For low-side applications, connect to ground side of sense resistor.
IN+	8	Input	Shunt resistor positive sense input. For high-side applications, connect to bus-voltage side of sense resistor. For low-side applications, connect to load side of sense resistor.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
V _S	Supply voltage		-0.3	22	V
V _{IN+} , V _{IN-}	Analog inputs	Differential (V _{IN+}) – (V _{IN-}) ⁽²⁾	-12	12	V
		V _{IN+} , V _{IN-} , with respect to GND ⁽²⁾	-20	120	
V _{OUT}	Analog output		GND – 0.3	(V _S) + 0.3	V
	Comparator reset pin		GND – 0.3	(V _S) + 0.3	V
	Comparator analog input		GND – 0.3	MIN of 5.5 or V _S	V
	Comparator Output		GND – 0.3	22	V
	Input current into any pin			5	mA
T _A	Operating temperature		-55	150	°C
T _J	Junction temperature		-65	150	°C
T _{stg}	Storage temperature		-65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

(2) V_{IN+} and V_{IN-} are the voltages at the IN+ and IN– pins, respectively.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000
		Charged device model (CDM), per AEC Q100-011	±1000

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CM}	Common-mode input range	-4	48	110	V
V _S	Operating supply voltage	2.7	5	20	V
V _{SENSE}	Differential sense input range	0		V _S / G	V
T _A	Operating free-air temperature	-40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		INA310x-Q1	UNIT
		DGK (VSSOP)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	172.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	63.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	93.8	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	9.8	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	92.2	°C/W

7 Detailed Description

7.1 Overview

The INA310x-Q1 is a high or low-side high-speed current-sense amplifier that offers a wide common-mode range, precision zero-drift topology, excellent common-mode rejection ratio (CMRR) and fast slew rate. Different gain versions are available to optimize the output dynamic range based on the application. The INA310x-Q1 is designed using an architecture that enables low input bias current of 20 μ A with a specified common-mode voltage range from -4 V to 110 V with signal bandwidths up to 1.3 MHz. The INA310x-Q1 incorporates an open-drain comparator and internal reference providing a 0.6-V threshold. An external resistor divider sets the current trip point. The comparator includes a latching capability, that can be made transparent by grounding (or leaving open) the **RESET** pin (see the *RESET Function* section).

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Amplifier Input Common-Mode Signal

The INA310x-Q1 supports large input common-mode voltages from -4 V to +110 V. The internal topology of the INA310x-Q1 enables the common-mode range to not be restricted by the power-supply voltage (**V_S**). Due to this feature, the INA310x-Q1 can be used for both low-side and high-side current-sensing applications that extend beyond the supply range of 2.7 V to 20 V.

7.3.2 Input-Signal Bandwidth

The INA310x-Q1 is available with several gain options, including 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V. The unique multistage design enables the amplifier to achieve high bandwidth at all gains. This high bandwidth provides the throughput and fast response that is required for the rapid detection and processing of overcurrent events.

7.3.3 Low Input Bias Current

The INA310x-Q1 inputs draw a 20- μ A input bias current per pin at a common-mode voltage as high as 110 V, which enables precision current sensing on applications that require lower current leakage. Unlike many high voltage current sense amplifiers whose input bias currents are proportional to the common-mode voltage, the input bias current of the INA310x-Q1 remains flat over the entire common-mode voltage range.

7.3.4 Low **V_{SENSE}** Operation

The INA310x-Q1 features high performance operation across the entire valid **V_{SENSE}** range. The zero-drift input architecture of the INA310x-Q1 provides the low offset voltage and low offset drift needed to measure low **V_{SENSE}** levels accurately across the wide operating temperature of -40°C to +125°C. Low **V_{SENSE}** operation is particularly beneficial when using low ohmic shunts for high current measurements, as power losses across the

shunt are significantly reduced. V_{SENSE} low level is only limited by the output swing to GND (V_{SN}). The minimum V_{SENSE} is limited to V_{SN} divided by Gain.

7.3.5 Wide Fixed Gain Output

The INA310x-Q1 maximum gain error is 0.15% at room temperature, with a maximum drift of 10 ppm/ $^{\circ}\text{C}$ over the full temperature range of -40°C to $+125^{\circ}\text{C}$. The INA310x-Q1 is available in multiple gain options of 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V, which the system designer should select based on their desired signal-to-noise ratio and other system requirements, such as the dynamic current range and full-scale output voltage target.

The INA310x-Q1 closed-loop gain is set by a precision, low-drift internal resistor network. The ratio of these resistors are excellently matched, while the absolute values may vary significantly. TI does not recommend adding additional resistance around the INA310x-Q1 to change the effective grain because of this variation.

7.3.6 Wide Supply Range

The INA310x-Q1 operates with a wide supply range from 2.7 V to 20 V. While the input voltage range of the INA310x-Q1 is independent of the supply voltage, the output voltage is bound by the supply voltage applied to the device. The output voltage can range from as low as 20 mV to as high as 200 mV below the supply voltage.

7.3.7 Integrated Comparator

The INA310x-Q1 incorporates an open-drain comparator with an internal reference providing a 0.6-V threshold. The comparator input (CMP_{IN}) can take voltage from 0 V up to 5.5 V or equal to power-supply voltage (if it is lower than 5.5 V). The comparator has a built-in hysteresis of 8 mV (typical). [Figure 7-1](#) shows the hysteresis, which is the difference between the rising-edge threshold and the falling-edge threshold. The hysteresis makes stable switching at the comparator output by providing noise immunity at comparator input.

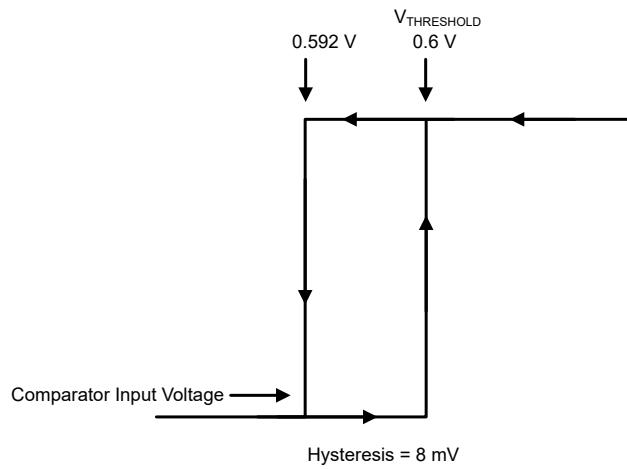

Figure 7-1. The Comparator Threshold and Hysteresis

The open-drain output of the comparator can be tied to voltage range of 0 to 20 V (independent of power supply) through a pullup resistor. When the voltage at the comparator input (CMP_{IN}) exceeds 0.6 V, the output of the comparator goes high. When the voltage at the comparator input falls below falling-threshold (0.6 V – Hysteresis), the output of the comparator is pulled low by an internal open-drain transistor.

7.3.8 RESET Function

The $\overline{\text{RESET}}$ function allows the comparator to work in transparent mode or latching mode. [Figure 7-2](#) shows the two modes of the $\overline{\text{RESET}}$ function. When the $\overline{\text{RESET}}$ pin is left open or connected to GND the comparator functions in a transparent mode. In transparent mode comparator output (CMP_{OUT}) responds as a normal comparator. When the $\overline{\text{RESET}}$ pin is connected to the supply voltage, the pin operates in latching mode. In the latching mode when the comparator is triggered by the comparator input going higher than 0.6 V, the output of the comparator stays high irrespective of comparator input after. To release the comparator from the latching

mode, the $\overline{\text{RESET}}$ pin must be pulled to GND or released to open. The $\overline{\text{RESET}}$ pin can take a voltage range from 0 V to the power-supply voltage.

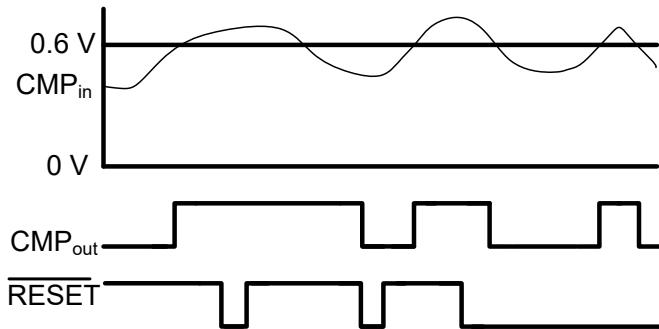

Figure 7-2. The Comparator $\overline{\text{RESET}}$ Function

7.3.9 Short Propagation Delay

The combination of a high-speed current sense amplifier and a fast comparator provides a short total propagation delay of 1 μs . The sense voltage (across the shunt resistor) propagates through the output where the output is divided down with the resistor divider to the comparator input and then to the comparator output. An external resistor divider at V_{OUT} sets overcurrent threshold. The total propagation delay is time taken from when the sense voltage (across the shunt resistor) exceeds the overcurrent threshold to when the comparator output drives high. The short propagation delay makes the INA310x-Q1 well suited for overcurrent protection in systems sensitive to overcurrent events.

7.3.10 Comparator Input Bias Current

The INA310x-Q1 comparator input has a built-in circuit to protect the input devices in case of large input differential voltage. This circuit results in the input bias current (I_{BCMPIN}) curve against input voltage (V_{CMPIN}) as shown in Figure 7-3. The I_{BCMPIN} reduces with V_{CMPIN} from 0 V to 0.4 V, I_{BCMPIN} is under 20 nA at 25°C for V_{CMPIN} range from 0.4 V to 1.2 V, and I_{BCMPIN} increases with V_{CMPIN} from 1.8 V to 5.5 V. The nature of I_{BCMPIN} does not contribute to the inaccuracy of the comparator alert threshold voltage ($V_{\text{THRESHOLD}}$) significantly because the I_{BCMPIN} goes below 20 nA when the input voltage is close to the threshold voltage (0.6 V). Avoid using a high-value resistor for the divider network for better $V_{\text{THRESHOLD}}$ accuracy. The sum of the two resistors in the divider network as shown in *Overcurrent Threshold Connection* is recommended to keep lower than 100 k Ω .

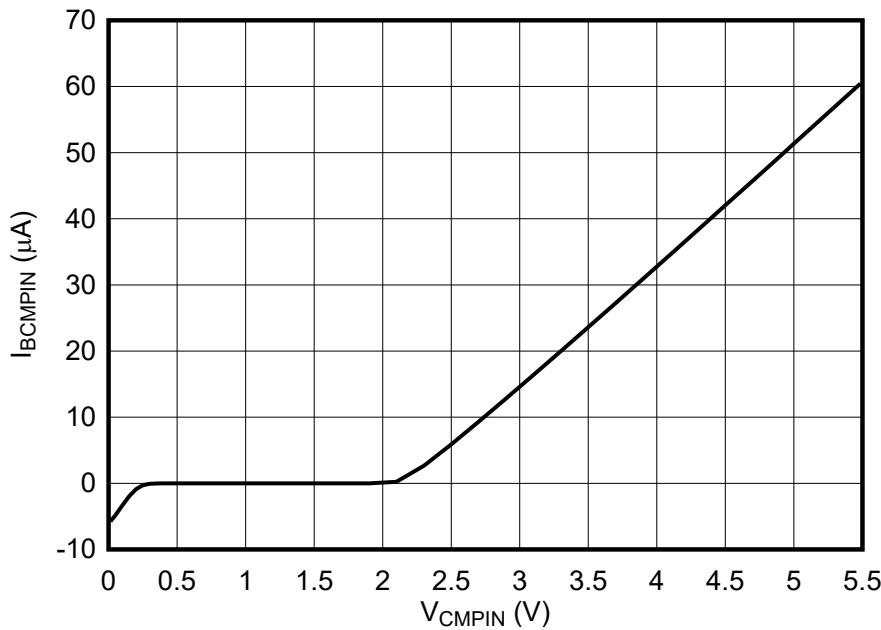

Figure 7-3. Comparator I_{BCMPIN} vs V_{CMPIN}

7.4 Device Functional Modes

7.4.1 Basic Connections

Figure 7-4 shows a basic circuit connection for INA310x-Q1. The INA310x-Q1 is configurable to allow for unidirectional high-side or low-side, current-sensing operation. The input pins (IN+ and IN-) must be connected as closely as possible with Kelvin connections to the shunt resistor to minimize any resistance in series with the shunt resistance. The *Layout* section provides the layout guidelines and a layout example.

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device V_S pin. The recommended value of a bypass capacitor is 0.01 μF .

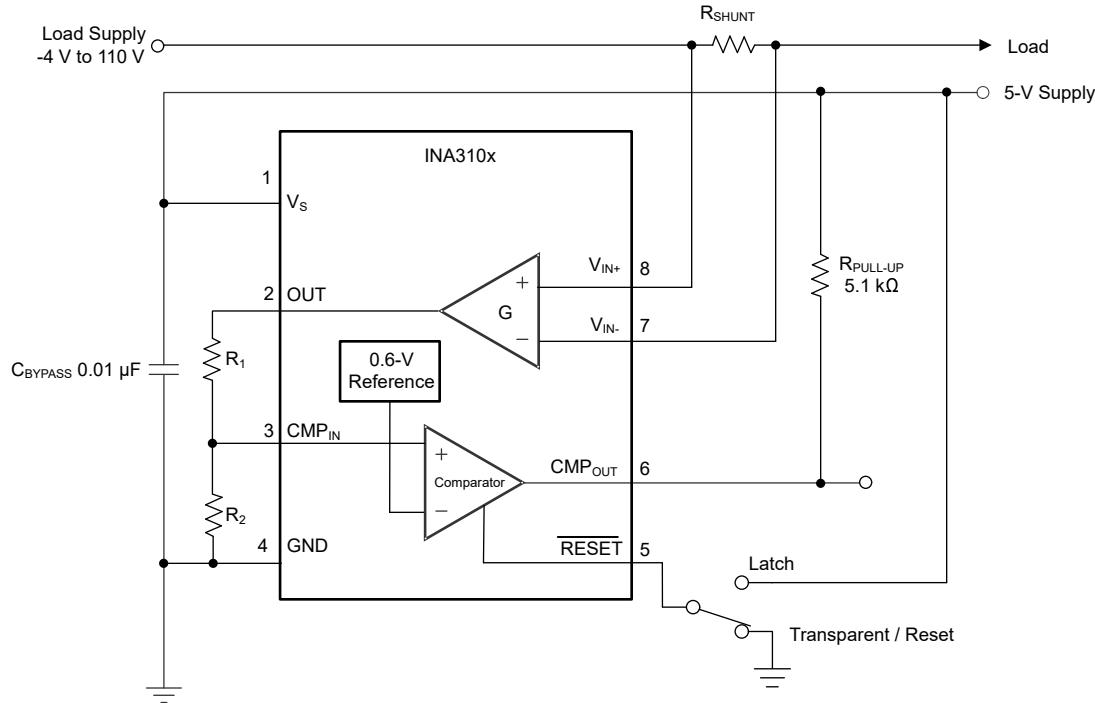

Figure 7-4. INA310x-Q1 Basic Connections

7.4.1.1 Overcurrent Threshold Connection

The INA310x-Q1 comparator in Figure 7-4 is configured to provide overcurrent alert signal when the current through R_{SHUNT} exceeds the overcurrent threshold. OUT voltage times R_2 divided by R_1 and R_2 compared to the internal reference voltage (0.6 V) sets the overcurrent threshold. Equation 1 shows the relation of the overcurrent threshold with gain, R_{SHUNT} , R_1 and R_2 .

$$I_{Sense_Alert_Threshold} = \frac{0.6 \times (R_1 + R_2)}{R_2 \times G \times R_{Shunt}} \quad (1)$$

R_1 and R_2 load OUT, therefore TI recommends to set the sum of these resistors higher than 10k. This helps keep the high swing range at the OUT and lower total supply current. The high value of these resistors will contribute to inaccuracy in comparator alert threshold voltage ($V_{THRESHOLD}$) as mentioned in [Comparator Input Bias Current](#). The [Design Requirements](#) section shows an example of resistors values to set the overcurrent threshold.

7.4.2 High-Side Switch Overcurrent Shutdown

The INA310x-Q1 measures differential voltage developed by current flowing through a current-shunt resistor. Figure 7-5 shows the circuit with INA310x-Q1 used for turning off the high-side switch in case of overcurrent. When the current exceeds overcurrent threshold, the comparator output (CMP_{OUT}) signal goes high. This signal from the comparator drives through the Q1 transistor to the gate of the high-side switch, causing the switch to shut down. The Q1 transistor helps isolate CMP_{OUT} from the high voltage of the Supply. There are three location options to have shunt resistor to measure unidirectional current. Option 1 and Option 2 are high-side current sensing, and Option 3 is low-side current sensing. Though both are high-side current sensing, Option 1 accounts for the current flowing through the Q1 transistor, and Option 2 does not. The advantages of high-side current sensing are that high-side sensing options do not contribute to ground disturbances and that high-side sensing can detect load shorts. In high-side current sensing, input common-mode is close to the power supply so a current-sensing amplifier with high CMRR and high common-mode is required for high-accuracy measurement. The low-side current sensing does not require a high-voltage, current-sensing amplifier as common mode remains very close to the ground. The disadvantages of low-side current sensing are that low-side sensing options contribute to ground disturbances and that low-side current sensing cannot detect load shorts.

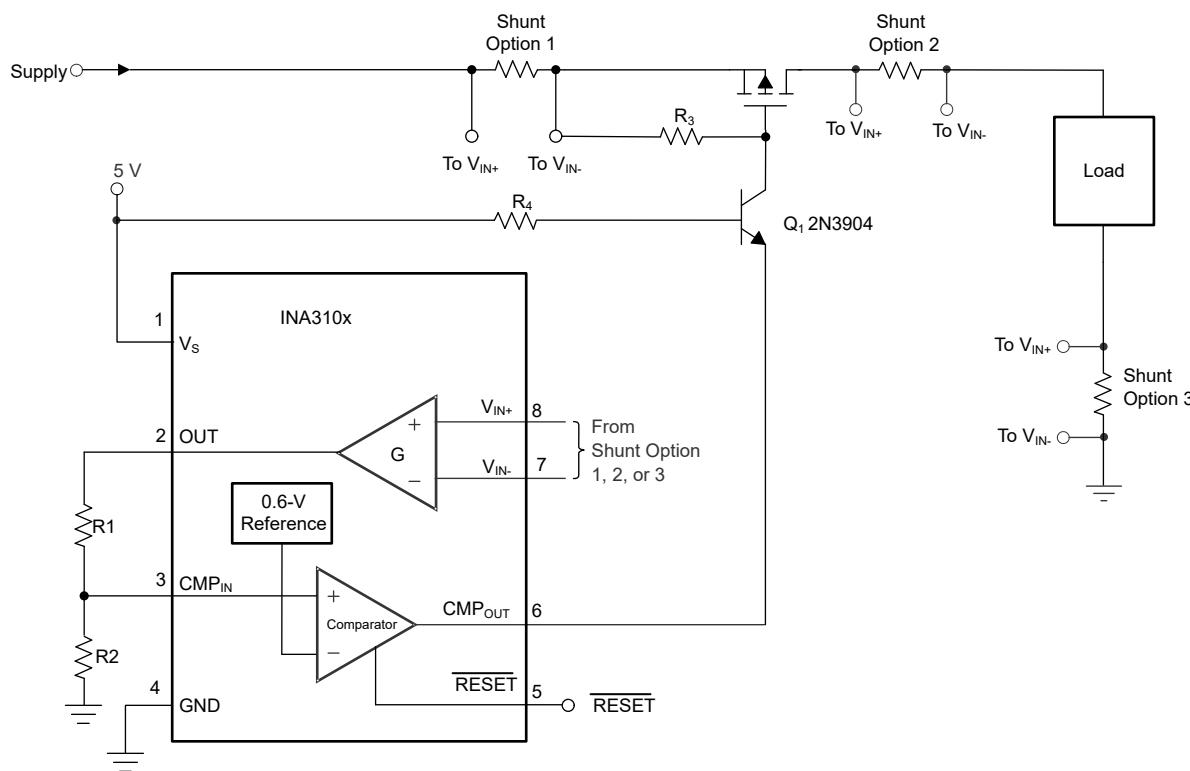

Figure 7-5. High-Side Switch for Overcurrent Shutdown

7.4.3 Bidirectional Overcurrent Comparator

The INA310x-Q1 can operate only in unidirectional mode, but Figure 7-6 shows that two INA310x-Q1s can be configured to provide a bidirectional overcurrent alert signal. The polarity of the differential voltage measured across the shunt resistor is in reverse for one current sense amplifier. Two INA310x-Q1 function to cover the opposite current directions, and therefore provide bidirectional overcurrent monitor function.

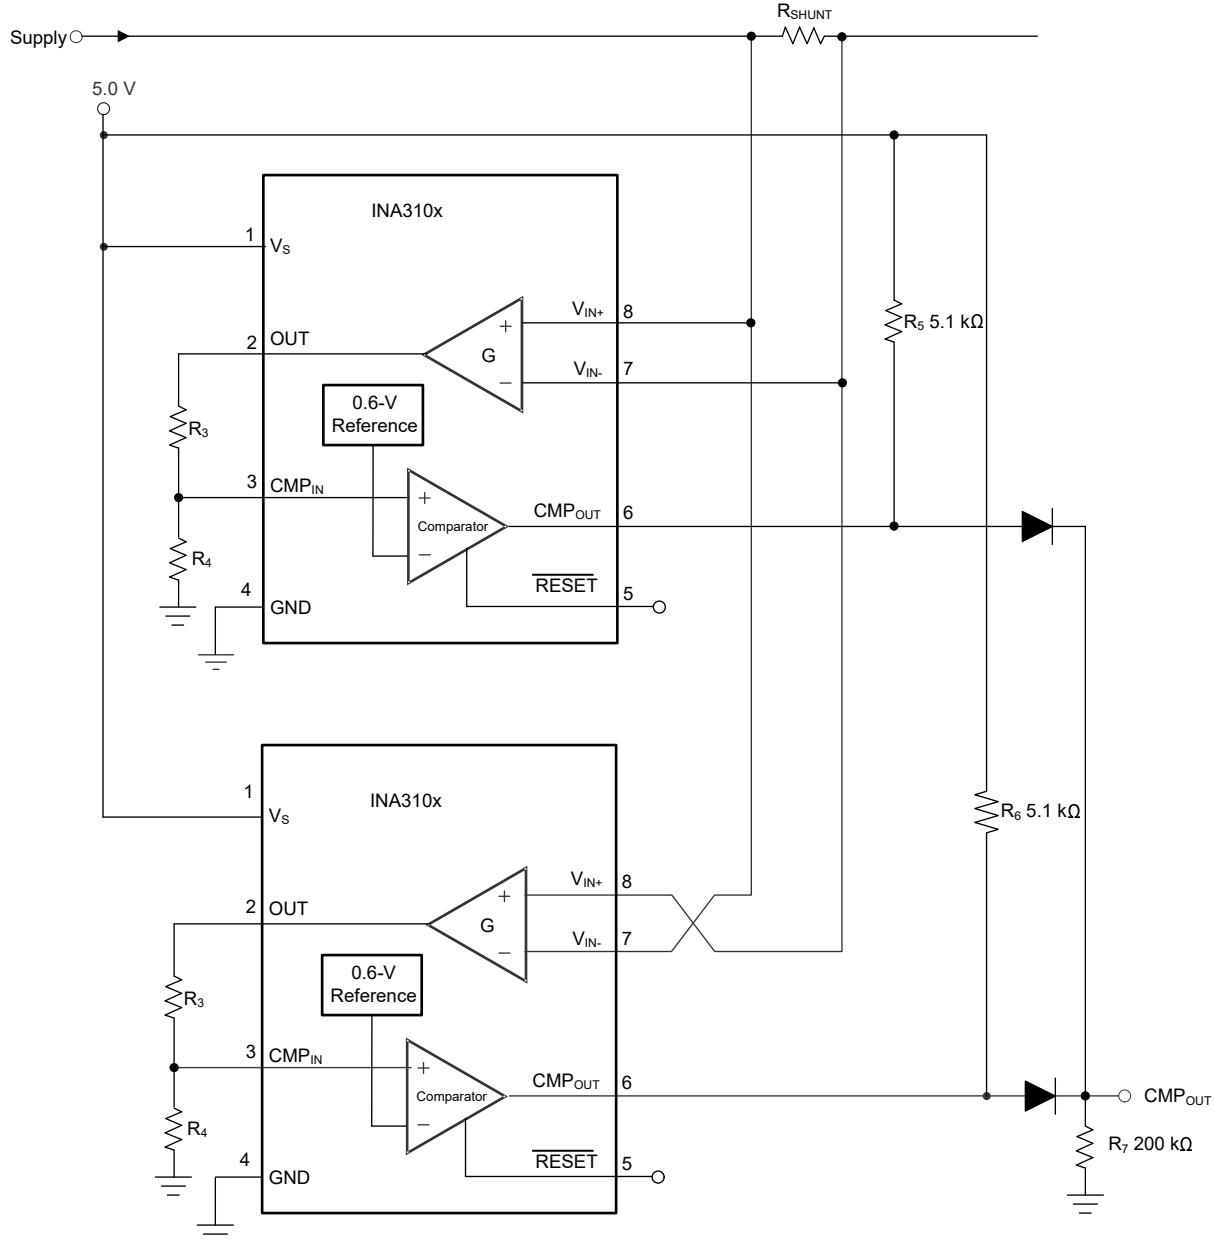

Figure 7-6. Ground Referenced Output

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The INA310x-Q1 amplifies the voltage developed across a current-sensing resistor as current flows through the resistor to the load. The wide input common-mode voltage range and high common-mode rejection of the INA310x-Q1 make the device usable over a wide range of voltage rails while still maintaining accurate current measurement.

8.1.1 R_{SENSE} and Device Gain Selection

To maximize the accuracy of a current sense amplifier, TI recommends to choose the largest current sense resistor value possible in an application. A larger value sense resistor maximizes the differential input signal for a given amount of current flow and reduces the error contribution of the offset voltage. However, there are practical limits as to how large the current-sense resistor value can be in a given application because of the physical dimensions of the resistor, package construction and maximum power dissipation. [Equation 2](#) gives the maximum value for the current-sense resistor for a given power dissipation budget:

$$R_{SENSE} < \frac{PD_{MAX}}{I_{MAX}^2} \quad (2)$$

where:

- PD_{MAX} is the maximum allowable power dissipation in R_{SENSE}.
- I_{MAX} is the maximum current that will flow through R_{SENSE}.

An additional limitation on the size of the current sense resistor and device gain is due to the power-supply voltage, V_S, and device swing-to-rail limitations. To make sure that the current-sense signal is properly passed to the output, both positive and negative output swing limitations must be examined. [Equation 3](#) provides the maximum values of R_{SENSE} and GAIN to keep the device from exceeding the positive swing limitation.

$$I_{MAX} \times R_{SENSE} \times GAIN < V_{SP} \quad (3)$$

where:

- I_{MAX} is the maximum current that will flow through R_{SENSE}.
- GAIN is the gain of the current-sense amplifier.
- V_{SP} is the positive output swing as specified in the data sheet.

To avoid positive output swing limitations when selecting the value of R_{SENSE}, there is always a trade-off between the value of the sense resistor and the gain of the device under consideration. If the sense resistor selected for the maximum power dissipation is too large, then it is possible to select a lower-gain device to avoid positive swing limitations.

The negative swing limitation places a limit on how small the sense resistor value can be for a given application. [Equation 4](#) provides the limit on the minimum value of the sense resistor.

$$I_{MIN} \times R_{SENSE} \times GAIN > V_{SN} \quad (4)$$

where:

- I_{MIN} is the minimum current that will flow through R_{SENSE}.

- GAIN is the gain of the current-sense amplifier.
- V_{SN} is the negative output swing of the device.

Table 8-1 shows an example of the different results obtained from using five different gain versions of the INA310x-Q1. From the table data, the highest gain device allows a smaller current-shunt resistor and decreased power dissipation in the element.

Table 8-1. R_{SENSE} Selection and Power Dissipation⁽¹⁾

PARAMETER		EQUATION	RESULTS AT $V_S = 5$ V				
			A1, B1 DEVICES	A2, B2 DEVICES	A3, B3 DEVICES	A4, B4 DEVICES	A5, B5 DEVICES
G	Gain		20 V/V	50 V/V	100 V/V	200 V/V	500 V/V

P_{SENSE}	Current-sense resistor power dissipation	$R_{SENSE} \times I_{MAX}^2$	2.5 W	1 W	0.5 W	0.25 W	0.1 W

(1) Design example with 10-A full-scale current with maximum output voltage set to 5 V.

8.2 Typical Application

The INA310x-Q1 is a unidirectional, current-sense amplifier capable of measuring currents through a resistive shunt with shunt common-mode voltages from -4 V to +110 V.

8.2.1 Current Sensing in a Solenoid Application

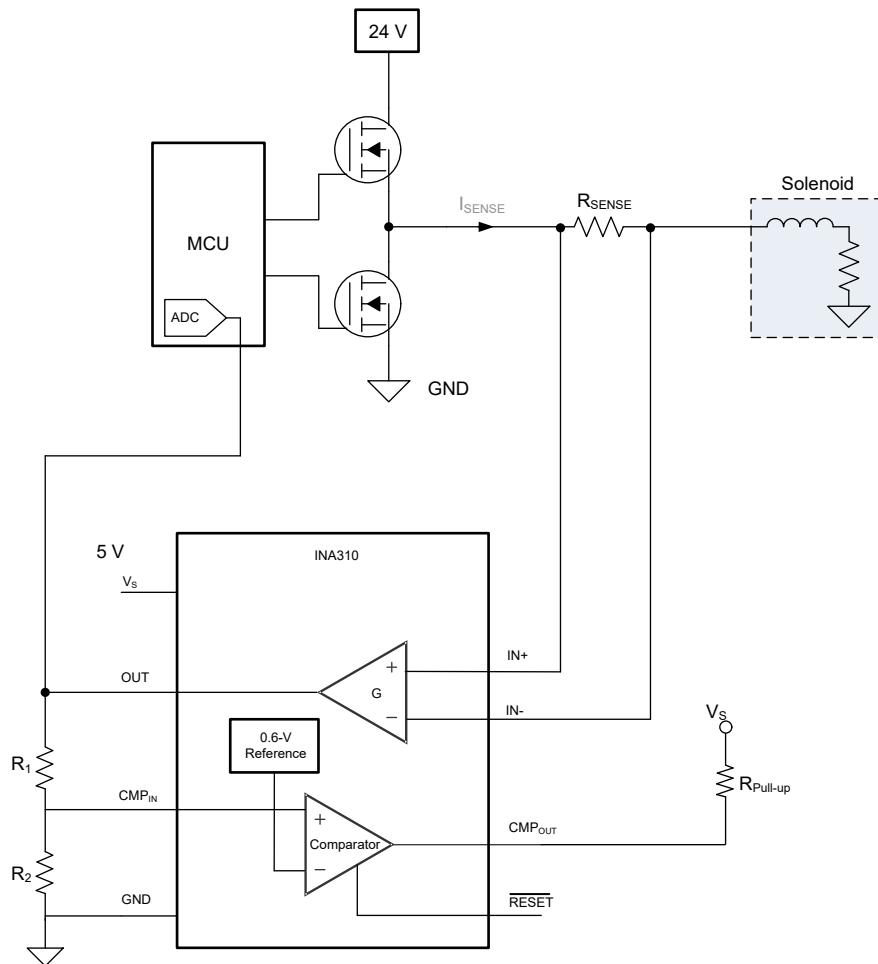

Figure 8-1. Current Sensing in a Solenoid Application

8.2.1.1 Design Requirements

In this example application, the common-mode voltage ranges from 0 V to 24 V. The maximum sense current is 1.5 A, an alert must be indicated if the current exceeds 1.9 A, and a 5 V supply is available for the INA310x-Q1. Following the design guidelines from [R_{SENSE} and Device Gain Selection](#), a R_{SENSE} of 50 mΩ and a gain of 50 V/V are selected to provide good output dynamic range. [Table 8-2](#) lists the design setup for this application.

Table 8-2. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
Power supply voltage	5 V
Common mode voltage range	0 V to 24 V
Maximum sense current	1.5 A
R _{SENSE} resistor	50 mΩ
Gain option	50 V/V
Over-current Threshold	1.9 A
R ₁	69.15 kΩ
R ₂	10 kΩ

8.2.1.2 Detailed Design Procedure

The INA310x-Q1 is designed to measure current in a typical solenoid application. The INA310x-Q1 measures current across the 50-mΩ shunt that is placed at the output of the half-bridge. The INA310x-Q1 measures the differential voltage across the shunt resistor, and the signal is internally amplified with a gain of 50 V/V. The output of the INA310x-Q1 is connected to the analog-to-digital converter (ADC) of an MCU to digitize the current measurements.

R₂ is fixed as 10 kΩ to avoid loading of OUT as recommended in [Overcurrent Threshold Connection](#). R₁ is calculated as 69.15 kΩ using [Equation 1](#).

$$1.9 \text{ A} = \frac{0.6 \text{ V} \times (R_1 + 10 \text{ k}\Omega)}{10 \text{ k}\Omega \times 50 \times 50 \text{ m}\Omega}$$

R₁ (69.15 kΩ) and R₂ (10 kΩ) divides down the output which is an input to the comparator. This sets the overcurrent alert threshold of 1.9 A.

Solenoid loads are highly inductive and are often prone to failure. Solenoids are often used for position control, precise fluid control, and fluid regulation. Measuring real-time current on the solenoid continuously can indicate premature failure of the solenoid, which can lead to a faulty control loop in the system. Measuring high-side current also indicates if there are any ground faults on the solenoid or the FETs that can be damaged in an application. The INA310x-Q1, with high bandwidth and slew rate, can be used to detect fast overcurrent conditions to prevent the solenoid damage from short-to-ground faults.

8.2.1.3 Overload Recovery With Negative V_{SENSE}

The INA310x-Q1 is a unidirectional current sense amplifier that is meant to operate with a positive differential input voltage (V_{SENSE}). If negative V_{SENSE} is applied, the device is placed in an overload or saturated condition and requires time to recover after V_{SENSE} returns positive. The required overload recovery time increases with more negative V_{SENSE}.

8.2.1.4 Application Curve

Figure 8-2 shows the output response of a solenoid.

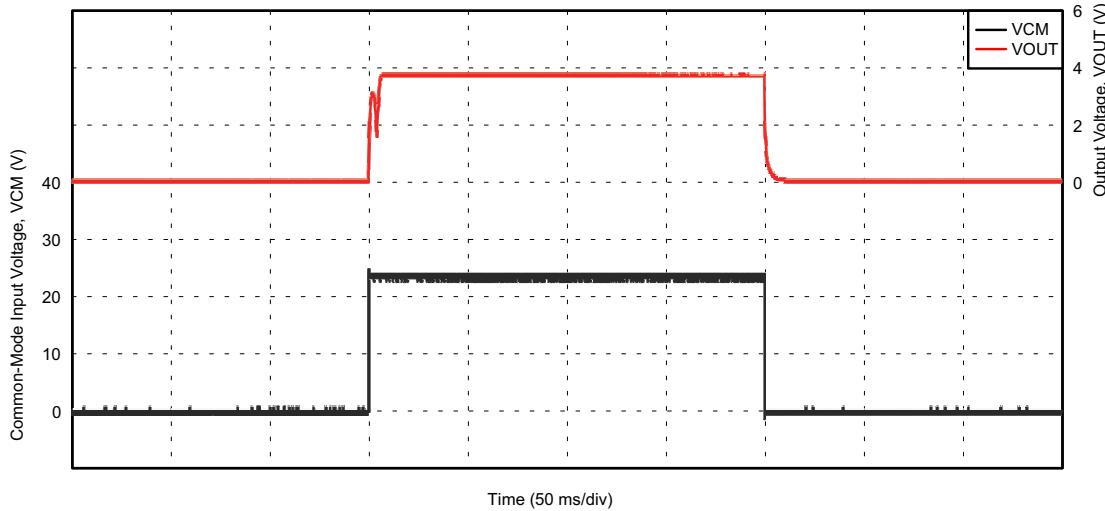

Figure 8-2. Solenoid Control Current Response

8.2.2 Low-Side Switch Overcurrent Shutdown

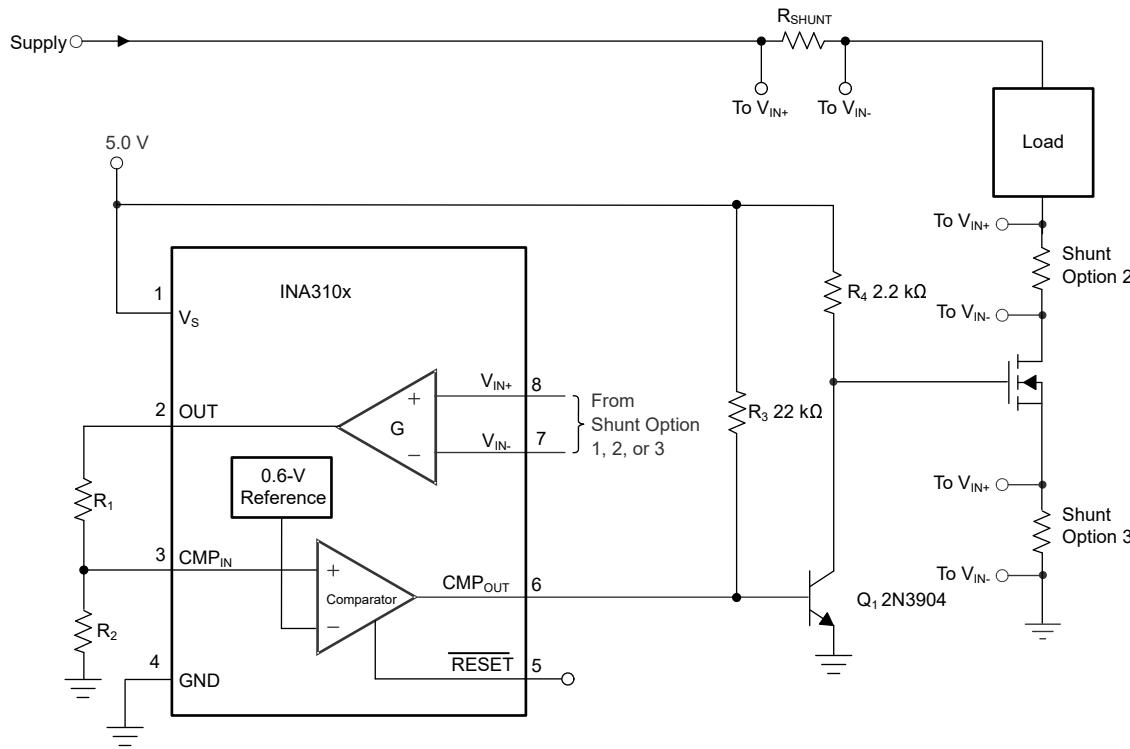

Figure 8-3. Low-Side Switch Overcurrent Shutdown

8.2.2.1 Design Requirements

The INA310x-Q1 measures current through a resistive shunt with current flowing in one direction that enables detection of an overcurrent event only when the differential input voltage exceeds the threshold limit. When the current reaches the set limit of the divider of R_1 and R_2 , the output of comparator (CMP_{OUT}) transitions high, which turns on Q_1 , pulls the gate of the pass-FET low, and turns off the flow of the current. In this example application, the common-mode voltage is set at 5 V. The maximum sense current is 1 A, an alert must be

indicated if the current exceeds 1.2 A, and a 5 V supply is available for the INA310x-Q1. Following the design guidelines from [R_{SENSE} and Device Gain Selection](#), a R_{SHUNT} of 100 mΩ and a gain of 20 V/V are selected to provide a good output dynamic range. [Table 8-3](#) lists the design setup for this application.

Table 8-3. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
Power supply voltage	5 V
Common mode voltage range	5 V
Maximum sense current	1 A
R _{SENSE} resistor	100 mΩ
Gain option	20 V/V
Over-current Threshold	1.2 A
R ₁	10.2 kΩ
R ₂	3.4 kΩ

8.2.2.2 Detailed Design Procedure

[Figure 8-3](#) shows the basic connections to the INA310x-Q1. The inputs terminals (IN+ and IN-) must be connected to the current sense resistor as close as possible to minimize any resistance in series with the shunt resistor. The INA310x-Q1 measures current across the 100-mΩ shunt that is placed in series with load. The INA310x-Q1 measures the differential voltage across the shunt resistor, and the signal is internally amplified with a gain of 20 V/V.

R₁ is fixed as 10.2 kΩ to avoid loading of OUT as recommended in [Overcurrent Threshold Connection](#). R₂ is calculated as 3.4 kΩ using [Equation 1](#). R₁ (10.2 kΩ) and R₂ (3.4 kΩ) divides down the output which is an input to the comparator. This sets the overcurrent alert threshold of 1.2 A.

8.2.2.3 Application Curve

[Figure 8-4](#) shows the output response the current sense amplifier and the comparator in event of overcurrent.

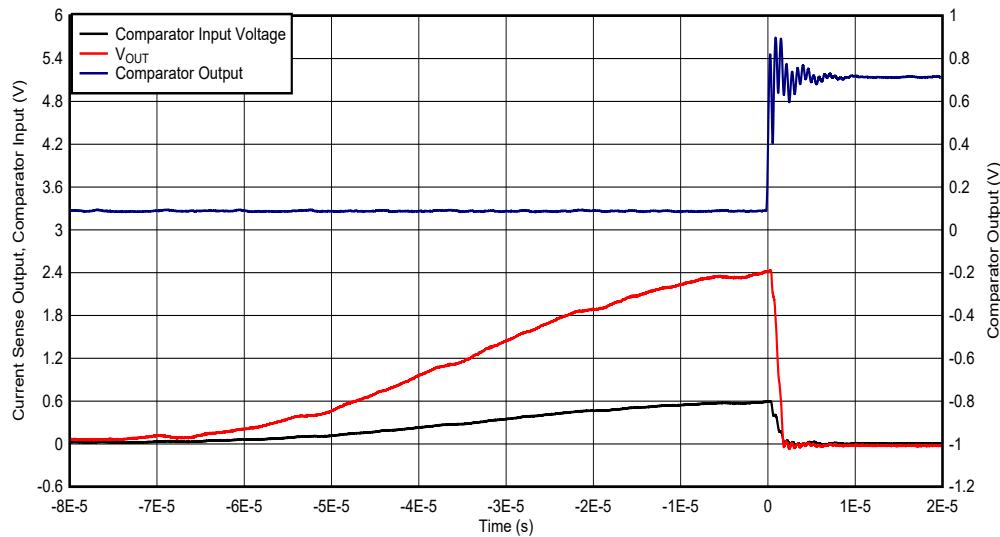

Figure 8-4. Low-Side Switch Overcurrent Shutdown Response

8.3 Power Supply Recommendations

The INA310x-Q1 makes accurate measurements beyond the connected power-supply voltage (V_S) because the inputs (IN+ and IN-) can operate anywhere between -4 V and 110 V independent of V_S. For example, with the V_S power supply equal to 5 V, the common-mode voltage of the measured shunt can be as high as 110 V.

8.3.1 Power Supply Decoupling

Place the power-supply bypass capacitor as close to the power-supply and ground pins as possible. TI recommends a bypass capacitor value of $0.1 \mu\text{F}$. Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

8.4 Layout

8.4.1 Layout Guidelines

Attention to good layout practices is always recommended.

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique makes sure that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as close to the device power-supply and ground pins as possible. The recommended value of this bypass capacitor is $0.1 \mu\text{F}$. Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

9 Device and Documentation Support

9.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

9.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

DGK0008A

PACKAGE OUTLINE

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

NOTES:

PowerPAD is a trademark of Texas Instruments.

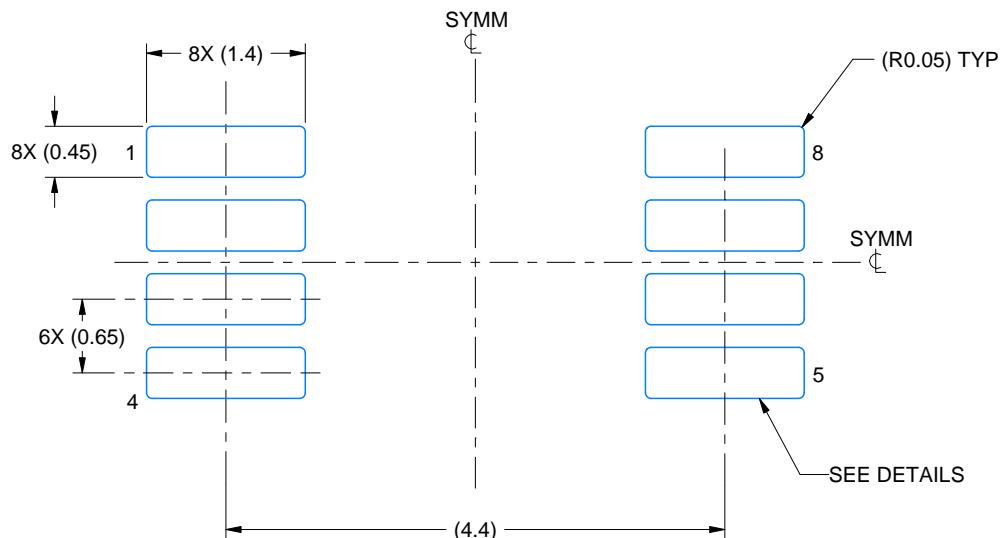

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

EXAMPLE BOARD LAYOUT

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 15X

4214862/A 04/2023

NOTES: (continued)

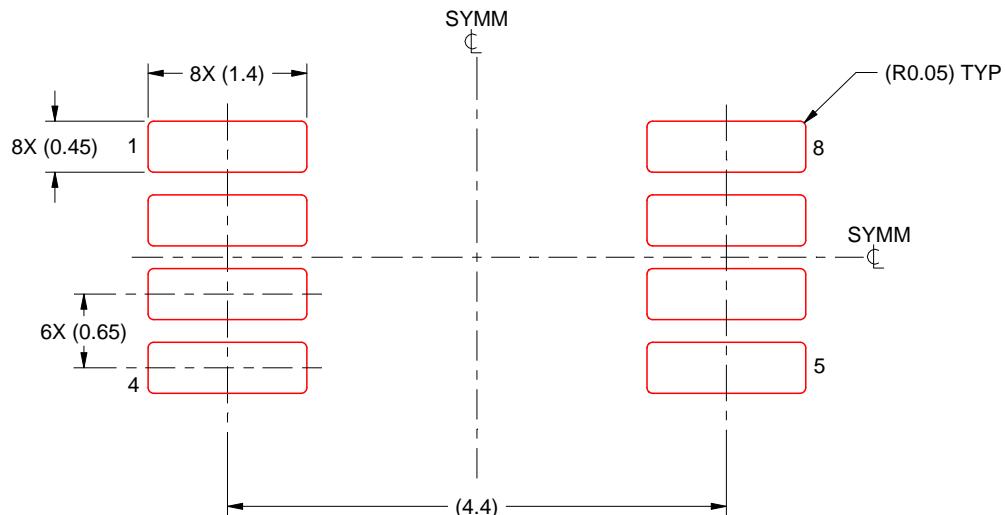

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.

EXAMPLE STENCIL DESIGN

DGK0008A

™ VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE
SCALE: 15X

4214862/A 04/2023

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.
